

Food Intolerance by The Food Xplorer (FOX)

Introduction:

The Food Xplorer (FOX) is an in-vitro diagnostic test based on Enzyme-Linked Immunosorbent Assay (ELISA) for the semi quantitative determination of specific immunoglobulin G (IgG).

Use :

The Food Xplorer (FOX) is a semi-quantitative in vitro diagnostic test for the determination of specific immunoglobulin G (IgG) against 286 food antigens. The Food Xplorer is suitable for use with serum or plasma. FOX can be used to support dietary clarification and to monitor dietary compliance. Furthermore, FOX can be used in case of reasonable suspicion of immunologically caused food intolerance. Before starting a diet based on FOX results, it is important to discuss the results with a physician or a dietician.

Principle:

FOX is a solid-phase immunoassay test based on Enzyme-Linked Immunosorbent Assay (ELISA). Food extracts, which are coupled to nanoparticles, are deposited in a systematic fashion onto a solid phase forming a macroscopic array. First, the particle bound proteins react with specific IgG that is present in the patient's sample. After incubation, non-specific IgG is washed off. The procedure continues by adding an enzyme labelled anti-human IgG detection antibody which forms a complex with the particle bound specific IgG. After a second washing step, substrate is added which is converted to an insoluble, coloured precipitate by the antibody-bound enzyme. Finally, the enzyme-substrate reaction is stopped by adding a blocking reagent. The amount of precipitate is proportional to the concentration of specific IgG in the patient sample. The lab test procedure is followed by image acquisition and analysis using the ImageXplorer device. The test results are analysed with MADx's RAPTOR SERVER Analysis Software and reported in IgG classes.
